

HOW TO PREDICT FIELD DURABILITY  
IMPROVEMENTS FROM REDESIGN CREDIT NUMBERS

INTRODUCTION

DEFINITION: A REDESIGN CREDIT NUMBER assigned to a part which fails and is then redesigned or changed is a number between 0 and 1 which represents the fraction of such redesigned parts which would survive the number of hours at which the original part failed.

EXAMPLE: For example, if a certain part fails in  $X_0$  hours and is then redesigned with a REDESIGN CREDIT NUMBER of 0.8, this tells us that .8 (i.e., 80%) of such redesigned parts would survive the same  $X_0$  hours of service at which the original part had failed. In other words, we predict that the failure probability of the redesigned part for  $X_0$  hours of service is  $1 - 0.8 = 0.2$ .

IN GENERAL: A REDESIGN CREDIT NUMBER  $P$  assigned to a part which initially failed in  $X_0$  hours (before redesign) is predicted to have a survival probability  $P$  for the same  $X_0$  hours of service after it is redesigned.

In determining the improved durability on a log-log plot of failures per machine versus hours of operation we assign the part in question the fraction  $1 - p = q$  failures at  $X_0$  hours instead of the original 1 failure at  $X_0$  hours when the part was still underdesigned.

Plotting HOURS TO FAILURE as ABSCISSA and FAILURES PER MACHINE as ORDINATE on LOG-LOG PAPER yields the LINE A in FIGURE 1, from which we obtain the following parameters :

$$b = 1.05 \quad (\text{Slope of Line A, i. e., WEIBULL SLOPE})$$

$$\theta = 66 \text{ hours} \quad (\text{Characteristic Life at 1 Failure/Machine})$$

TABLE II

( AFTER REDESIGN CREDITS ARE COUNTED )

| REDESIGN CREDIT ON FAILED PART | ORIGINAL FAILURE CUMULATIVE TOTAL | HOURS TO FAILURE | CUM. FAILURE TOTAL AFTER REDESIGN CREDITS | NUMBER OF MACHINES WHICH HAVE RUN THE INDICATED HRS. | REVISED FAILURES PER MACHINE (AFTER REDESIGN CREDIT) |

| .9                             | 3                                 | 68               | 1.1                                       | 3  | .367   |
| .7                             | 4                                 | 80               | 1.4                                       | 3  | .467   |
| .5                             | 5                                 | 100              | 1.9                                       | 3  | .633   |
| .8                             | 6                                 | 135              | 2.1                                       | 3  | .700   |
| .9                             | 7                                 | 150              | 2.2                                       | 3  | .733   |
| .8                             | 8                                 | 170              | 2.4                                       | 3  | 1.800  |
| .3                             | 6                                 | 190              | 1.9 = 1.2 + .7                            | 2 (machine 2 & 3)                                    | 0.950  |
| .8                             | 7                                 | 225              | 2.1 = 1.9 + .2                            | 2 (machine 2 & 3)                                    | 1.050  |

NOTE : The CUMULATIVE TOTAL AFTER REDESIGN CREDITS (column 4) is simply a summation of quantities  $(1 - p)$ , where each  $p$  = Redesign Credit Number in Column 1. Now, plotting HOURS TO FAILURE as ABSCISSA and REVISED FAILURES PER MACHINE as ORDINATE on LOG-LOG PAPER yields the LINE B in FIGURE 1. From LINE B of FIGURE 1 we obtain the new parameters (after redesign). These are :

$$b = 0.80 \quad (\text{Predicted Weibull Slope after redesign})$$

$$\theta = 209 \text{ hours} \quad (\text{Predicted Characteristic Life at 1 Failure/Machine (after redesign)})$$

LOG - LOG PLOTS OF FAILURE PER MACHINE

B: AFTER REDESIGN CREDITS ARE ASSIGNED

FIGURE 1

---

IMPROVEMENT CONCLUSION  
FOR THE REDESIGN CREDIT NUMBER EXAMPLE

---

In the example we have herein discussed , we conclude that the REDESIGN increases the characteristic life from 66 hours to **109** hours for the same type of service on these machines. The Weibull Slope is not changed significantly by the redesign .
